1 Objetivo

El presente documento tiene como propósito determinar la Potencia Máxima de generación del parque eólico Cabo Leones I. Para ello se proporciona la información técnica de los aerogeneradores G114 2,1MW y del Parque Eólico Cabo Leones I para la justificación de los valores obtenidos, como es requerido por lo anexos técnicos de la Norma Técnica de Seguridad y Calidad del Servicio (NTSyCS) y del “Anexo Técnico: Pruebas de potencia máxima en unidades generadoras”.

2 Alcance

La información y documentación proporcionada se limita únicamente a información técnica del Parque Eólico Cabo Leones I y el aerogenerador Gamesa G114 2,1MW de acuerdo a los artículos aplicables establecidos en el documento ***“ANEXO TÉCNICO: Pruebas de Potencia Máxima en Unidades Generadoras”***.

Para la determinación de la potencia máxima del parque eólico Cabo Leones I se utilizarán los registros de operación disponibles hasta la fecha de acuerdo a lo establecido en el artículo 39 del título VIII del anexo técnico correspondiente:

“Artículo 39 Potencia Máxima en unidades generadoras cuya fuente es renovable no convencional sin capacidad de regulación.

Para las unidades generadoras que no tengan capacidad de regulación, y que por lo tanto no sea aplicable lo establecido en el Artículo 16 del presente Anexo, el valor de Potencia Máxima deberá ser obtenido en función de registros de operación y mediciones de los recursos naturales que inciden en la operación de estas tecnologías.”

Las restricciones operativas y consideraciones serán descritas y justificadas en los apartados correspondientes de este documento.

3 Diseño e Información Técnica del Parque Eólico Cabo Leones I

3.1 Unifilar Subestación PE

A continuación, se presenta el unifilar de la subestación del Parque Eólico Cabo Leones I. En el mismo se pueden apreciar las protecciones a nivel de parque eólico y la potencia instalada por circuito.

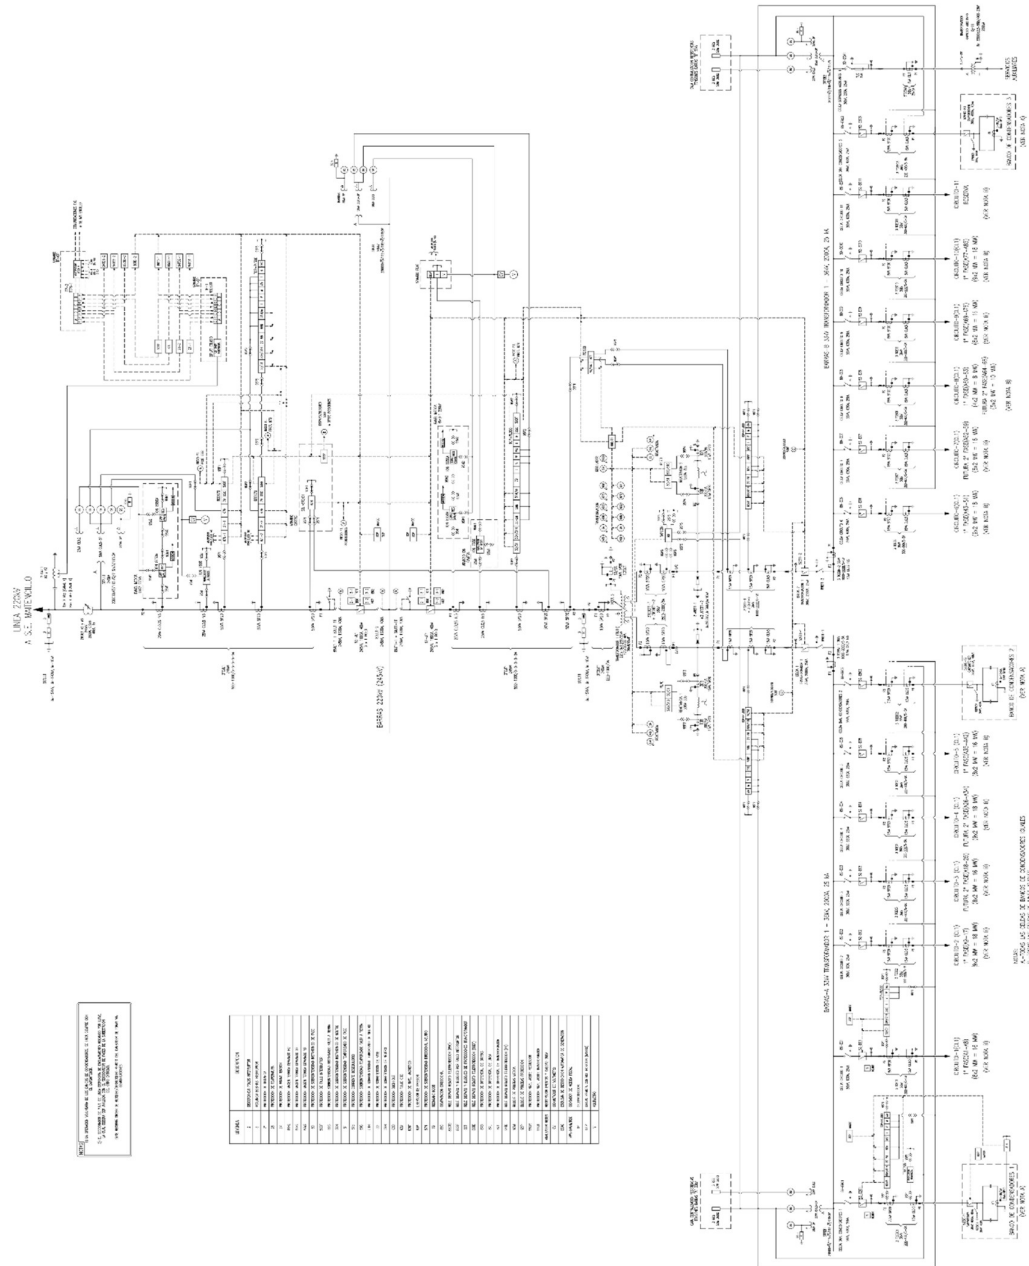

Figura 1. Esquema Unifilar Parque Eólico Cabo Leones I.

3.2 Unifilar red de MT

El Parque Eólico Cabo Leones I está compuesto por 55 aerogeneradores G114 2,170 MW sumando una potencia neta máxima de 119,350 MW. Estos aerogeneradores están distribuidos en 7 circuitos como se muestra en el diagrama unifilar de la red de media tensión. Para la conexión a la red de media tensión los aerogeneradores utilizan un transformador que eleva el voltaje de los 690 V a nivel de generador a los 33 kV a nivel de la red de media tensión. El conjunto del parque esta interconectado al Sistema Eléctrico Nacional por medio del transformador del parque eólico instalado en la subestación elevadora. Este transformador tiene una potencia nominal de 170 MVA y sube el voltaje de 33 kV a 220 kV.

Figura 2. Esquema Sistema Colector Parque Eólico Cabo Leones I.

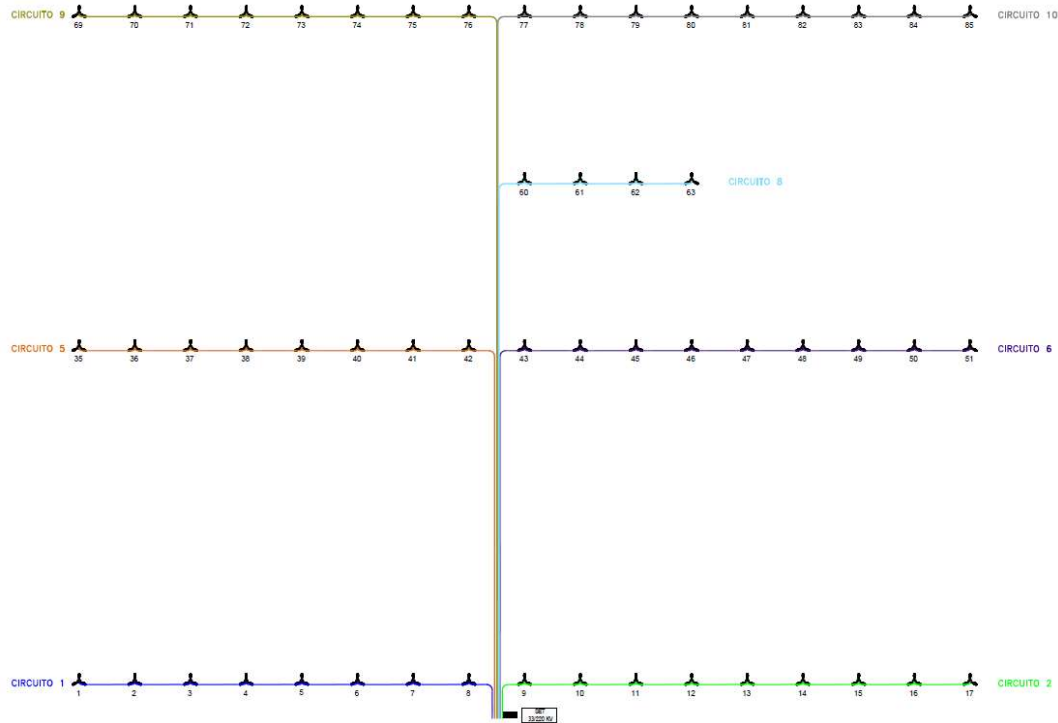

Figura 3. Implantación Sistema colector Parque Eólico Cabo Leones I.

3.3 Aerogenerador

La Máquina de Inducción Doblemente Alimentada (DFIM) es el sistema de conversión de energía mecánica en energía eléctrica, encargado de regular la potencia entregada a la red eléctrica y proporcionar funciones de protección y vigilancia.

El sistema DFIM está formado por un generador asíncrono trifásico con rotor bobinado accesible a través de anillos rozantes y de un convertidor de potencia (AC/DC/AC). El estator se conecta directamente a la red y el rotor a uno de los lados del convertidor (MSC), estando el otro lado conectado a la red (GSC). Este sistema consigue que el comportamiento del aerogenerador ante la red de distribución eléctrica sea similar al de un generador síncrono, más favorable para la red que un generador asíncrono convencional debido a que:

No existe pico de corriente en el momento de conexión a la red, a diferencia de los generadores asíncronos convencionales.

Existe un control de potencia reactiva continuo y regulable, a diferencia de los generadores asíncronos convencionales que consumen potencia reactiva lo que hace necesario el uso de bancos de condensadores para compensar. El controlador del convertidor de potencia (CCU) controla la potencia activa y reactiva permitiendo al usuario elegir el factor de potencia deseado de forma fija o dinámica a través de un controlador externo.

El rango de velocidad de funcionamiento es mucho mayor que en los generadores asíncronos convencionales, lo cual permite un mejor comportamiento tanto eléctrico como mecánico.

El sistema DFIM es capaz de trabajar con una velocidad de giro del rotor del generador superior a la velocidad de sincronismo. Asimismo, para optimizar la producción de energía con bajos vientos, el sistema es capaz de producir energía con una velocidad de giro del rotor por debajo de la velocidad de sincronismo. Este amplio rango dinámico de velocidad permite reducir las cargas que soporta el aerogenerador, así como mejorar la calidad de la energía inyectada a la red.

En la configuración de conexión empleada en la familia de aerogeneradores Gamesa 2,0/2,170 MW, el estator se conecta al secundario del transformador de media tensión (690Vac) a través de un interruptor automático (FG008), además de servir de elemento de protección contra posibles sobrecorrientes. Los bobinados del estator del generador se conectan en triángulo. El rotor se conecta al MSC, mientras que el GSC se conecta al secundario del transformador de media tensión (690Vac) mediante un contactor protegido por un interruptor automático (FG005) o fusibles, dependiendo de la tecnología empleada.

En la familia de generadores eólicos Gamesa 2,1MW existe una variante en la configuración de conexión y protección de la máquina a la red por medio del transformador de media tensión, que difiere levemente de las familias anteriormente mencionadas. El estator del generador sigue estando conectado al lado de baja tensión del transformador de media tensión a través del interruptor automático (FG008), mientras que los devanados del rotor lo hacen por medio de dos interruptores automáticos en serie (FG005 y FG005.2) en modo protección de acompañamiento o back-up.

Pese a que la tecnología del generador es de tipo asíncrono, el acoplamiento o conexión del aerogenerador a red se realiza de forma suave, sin intercambio de energía activa o reactiva entre la instalación y la red. Esto se debe a que el circuito magnético del generador ha sido previamente excitado, de forma controlada desde el rotor, por medio del convertidor. La perturbación de la tensión de la línea provocada por el acoplamiento a red del aerogenerador eólico es nula.

El convertidor electrónico de potencia garantiza un modo de funcionamiento síncrono con respecto a la red. La tensión y la frecuencia inducidas en el estator coinciden, en todo momento con las mismas variables de la red. Si la tensión o frecuencia de línea varían, las del estator del generador lo hacen en el mismo sentido y proporción. El comportamiento del convertidor en su conexión con la red es idéntico, ajustando la frecuencia de conmutación para que la forma de onda de la tensión resultante coincida en todo instante con la de la línea.

El esquema hardware del sistema es:

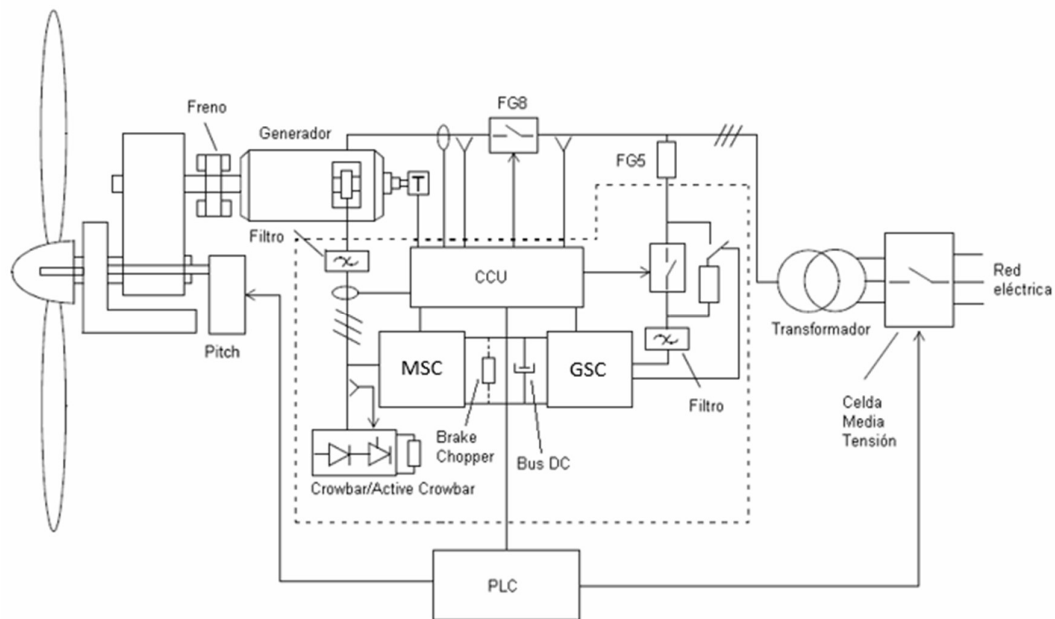

Figura 4. Esquema de hardware del aerogenerador Gamesa 2.0/2,1MW

El convertidor de potencia se compone de unos componentes principales y una serie de protecciones que se describen brevemente a continuación:

Principales particiones:

- **Convertidor lado máquina (MSC).** Este convertidor inyecta o extrae corriente en el rotor con frecuencia variable. Esta frecuencia es la necesaria para que en el estator se obtenga una tensión generada a 50/60Hz independiente de la velocidad de giro del rotor. Las consignas de corriente están gobernadas por la CCU, comunicándose vía bus de campo con el controlador PLC.
- **Convertidor lado línea (GSC).** Este convertidor regula la tensión del bus de continua, además de transferir la potencia necesaria entre la red y el rotor del generador.
- **Bus de continua.** Serie de condensadores conectados entre el GSC y MSC, que sirven como fuente estable de energía para suministrarla cuando sea requerida.
- **CCU.** Unidad de control del convertidor. Monitoriza los parámetros de la red y es la responsable de las alarmas de generación.

Protección del convertidor ante fallos del aerogenerador:

Ante fallos que provoquen el paso a emergencia, la CCU abre todas las protecciones que conectan el convertidor con la red. Si el aerogenerador estaba vertiendo energía a la red, este corte provocaría que la energía que se encuentra en el rotor del generador cause una brusca subida de la tensión que llevaría a la destrucción de los condensadores e IGBTs del convertidor. Para evitar este problema el sistema dispone de un equipo denominado crowbar. Este sistema, ante una brusca subida de tensión en el bus de continua, cortocircuita los devanados del rotor para que la energía sobrante se disipe en ellos.

Protección del convertidor ante incrementos de temperatura:

Durante el funcionamiento se producen aumentos de temperatura en los distintos componentes. El sistema mide las temperaturas en los devanados y anillos rozantes del generador, en los disipadores de calor de los IGBTs del convertidor, en el embarrado, en el transformador y en la tarjeta de control de los convertidores. Cuando la temperatura supera los parámetros preestablecidos, el aerogenerador pasará a un estado de operación que salvede la integridad del mismo.

Protección ante cortocircuitos:

El convertidor está protegido ante cortocircuitos, fallos de red y otros con interruptores automáticos y térmicos, tanto en el circuito de estator como en el del rotor.

Emisión de armónicos:

El convertidor utiliza IGBTs que conmutan a una frecuencia muy superior a la de la red (50/60Hz), lo que, unido a los filtros empleados, consigue que la potencia que se vierte a la red eléctrica tenga un contenido armónico que cumple con la normativa vigente de Calidad de Energía.

La información técnica más relevantes del aerogenerador se muestra en las siguientes tablas:

A continuación, se lista la información técnica más relevantes del aerogenerador que se muestra en las siguientes tablas:

3.3.1 Generador

	GENERADOR ELÉCTRICO 4 polos (50/60Hz)
Potencia Nominal [kW]	2170
Tipo Generador	Generador Asíncrono Doblemente Alimentado
Conexión Estator	Triángulo
Conexión Rotor	Estrella
Número de Polos	4
Sentido de Giro	En sentido agujas del reloj visto desde el eje del lado acoplamiento
Sondas Pt100	6 en devanados del estator 1 en el rodamiento del lado acoplamiento

	1 en el rodamiento del lado sin acoplamiento 1 en el cuerpo de anillos
Temperatura Ambiente [°C] *	-20 a +50
Altitud sobre Nivel del Mar [m]**	0 a 1000
Frecuencia Nominal [Hz]	50 / 60
Velocidad Nominal [rpm]	1680 / 2016
Rango de Velocidad [rpm]	1000-1950 / 1200-2340
Tensión Nominal [V]	690
Tensión Máxima del Rotor [V]	775
Factor de Potencia ***	0,95 cap – 1 – 0,95 ind
Grado de Protección (IEC 60034)	IP54 Máquina – IP23**** Cuerpo de anillos
Protección de la Corrosión (ISO 12944)*****	C3H Máquina – C4H Cuerpo de anillos - C5M Partes en contacto aire exterior
Sistema de Refrigeración	IC666 refrigeración por aire con intercambiador aire/aire
Aislamiento Estator / Rotor	F ó H / F ó H
Peso [kg]	≤ 9000
Pre-instalación Acelerómetros del Sistema Mantenimiento Predictivo	Incluido
Posibilidad Instalación Engrasador Automático	Sí

3.3.2 Convertidor

CONVERTIDOR DE POTENCIA	
Tecnología	Back to Back basado en IGBTs
Temperatura funcionamiento [°C]	-25 a 50
Altitud sobre Nivel del Mar [m]**	0 a 1000
Nivel de Protección Atmosférica (IEC 61439-1)	≥3
Tipo de Refrigeración	Aire - Agua/Glicol
Temperatura Máxima Aire Refrigeración [°C]	50
Temperatura Máxima Líquido Refrigerante [°C]	60
Grado de Protección	IP54
Nivel de Protección contra la Corrosión (ISO 12944)**	C3H
Frecuencia Nominal [Hz]	50Hz (±6%)
Tension Nominal [V]	690 (±10%)
Potencia nominal [kW]	2060 / 2170
Nivel de Armónicos (IEC 61400-21)	THC ≤ 2
Peso [kg]	< 2000

3.3.3 Transformador de aerogenerador

TRANSFORMADOR DE MEDIA TENSIÓN	
Potencia Asignada [kVA]	2350
Tipo Transformador	Transformador Trifásico, Seco Encapsulado
Condición de Servicio	Interior
Tipo de Ventilación*	AF (Forzada)
Rango de Temperatura Operación [°C]	-25 a +55
Clase Ambiental (IEC 60076-11)	E2
Clase Climática (IEC 60076-11)	C2
Comportamiento frente al Fuego (IEC 60076-11)	F1
Nivel de Protección contra la Corrosión (ISO 12944)	C4H
Altitud sobre Nivel del Mar [m]**	0 a 1000
Clase de Aislamiento/Térmico	F o H
Tensión Devanados de Baja Tensión [V]	3x690
Conexión Devanados de Baja Tensión	Estrella, neutro conectado directamente a tierra
Tensión Devanados de Media Tensión [kV]	Dependiente de la tensión de la red o subestación (por ejemplo 3x20-3x30-3x33-3x34.5-3x35kV)
Conexión Devanados de Media Tensión	Triángulo
Tomas intermedias Media Tensión	+/-2.5% +/-5%
Grupo de Conexión	Dyn11 o Dyn1
Frecuencia de Red [Hz]	50/60
Tensión más Elevada para el Material, Um, en Devanado MT (IEC 60076-3) [kV]	Dependiente de la tensión de la red o subestación (por ejemplo, 3x33kV ⇒ 36kV valor eficaz)
Nivel de Aislamiento Asignado de Corta Duración a Frecuencia Industrial en Devanado MT (IEC 60076-3) [kV]	Dependiente de la tensión más elevada del material (por ejemplo, 36kV ⇒ 70kV valor eficaz)

Nivel de Aislamiento Asignado a Impulsos Tipo Rayo en Devanado MT (IEC 60076-3) [kV]	Dependiente de la tensión más elevada del material. Columna 2 (por ejemplo, 36kV $\Rightarrow$ 170kV valor cresta)
Tensión más Elevada para el Material, Um, en Devanado MT (IEC 60076-3) [kV]	1.1
Nivel de Aislamiento Asignado de Corta Duración a Frecuencia Industrial en Devanado MT (IEC 60076-3) [kV]	3
Nivel de Aislamiento Asignado a Impulsos Tipo Rayo en Devanado MT (IEC 60076-3) [kV cresta]	8
Impedancia Cortocircuito 690V [%]	≤ 10.5 (valor aproximado)
Corriente Cortocircuito Secundario 690V [kA]	25 (valor aproximado)
Nivel de Descargas Parciales [pC]	≤ 10
Corriente magnetizante de inserción (Inrush) [A] ***	$< 8 \times I_n$
Sondas Pt-100	2 por fase en cada devanado de baja, en puntos calientes
Dimensiones Máximas (L*W*H) [mm]	2200*820*2255 (valores aproximados)
Peso [kg]	< 5700

3.3.4 Curva de potencia

La siguiente tabla muestra la potencia eléctrica [kW] como función de la velocidad del viento [m/s] horizontal referida a la altura del buje, ponderada en diez minutos, para diferentes densidades de aire [kg/m³]. La curva de potencia no incluye las pérdidas del transformador ni de los cables de alta tensión. La curva de potencia corresponde a la clase S del aerogenerador.

P [kW]	Density [kg/m ³]							
Ws [m/s]	1.225	1.09	1.12	1.15	1.18	1.21	1.24	1.27
3	14	11	12	12	13	14	14	15
4	93	79	82	85	88	91	95	98
5	236	205	212	219	225	232	239	246
6	438	386	397	409	420	432	444	455
7	714	632	650	668	687	705	724	742
8	1085	960	988	1015	1043	1071	1099	1126
9	1524	1368	1403	1438	1472	1507	1542	1570
10	1872	1753	1781	1807	1833	1859	1885	1901

Figura 5. Curva de Potencia del aerogenerador Gamesa 2,0/2,1MW

3.3.5 Curva de Generación de Potencia Reactiva

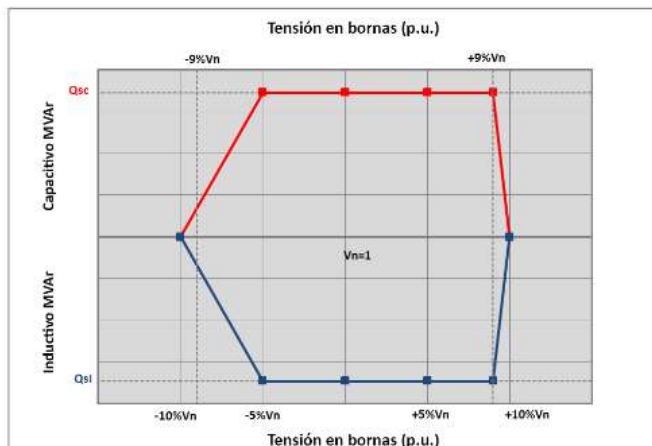

Los límites de la producción de potencia reactiva son 690 kVAr, considerando siempre como referencia el lado de BT del transformador principal. En la envolvente siguiente se muestra la curva de reactiva del aerogenerador G114 2,170 MW. Estos aerogeneradores son capaces de generar o consumir hasta 690 kVAr de potencia reactiva respectivamente. Estas capacidades de producción/consumo de reactiva se pueden mantener en un rango de 5 a 100% de la producción de potencia activa en las terminales de bajo voltaje del aerogenerador como se muestra en la Figura 6. Al llegar a la potencia activa de 5% hasta llegar al 0% la capacidad de potencia reactiva disminuye linealmente hasta llegar a cero.

	G2.1MW
P_{total_máx}	2,1MW
Q_{AEG_I}	-690kVAr
Q_{AEG_C}	690kVAr
P_{total_mín}	105kW

Figura 6. Curva generación de potencia reactiva aerogenerador Gamesa 2,0/2,1MW

Fuera del rango de tensión de -5 % / +10 % la potencia reactiva está limitada conforme a la tensión de la red eléctrica en el lado de BT del transformador. El límite viene impuesto por la máxima clasificación de intensidad y tensión del aerogenerador. Por tanto, el límite de potencia reactiva, en función de la tensión de la red, se define en la siguiente figura.

	G2.0MW	G2.1MW
Q _{AEG_I}	-655kVAr	-690kVAr
Q _{AEG_C}	655kVAr	690kVAr

Figura 7. Curva Generación de potencia reactiva aerogenerador Gamesa 2,0/2,1MW en función de la tensión.

4 ANTECEDENTES DE OPERACIÓN DE PARQUE EÓLICO CABO LEONES I

Como antecedentes de operación se ha tomado los datos de generación del año 2019, al considerarse un año natural como periodo representativo.

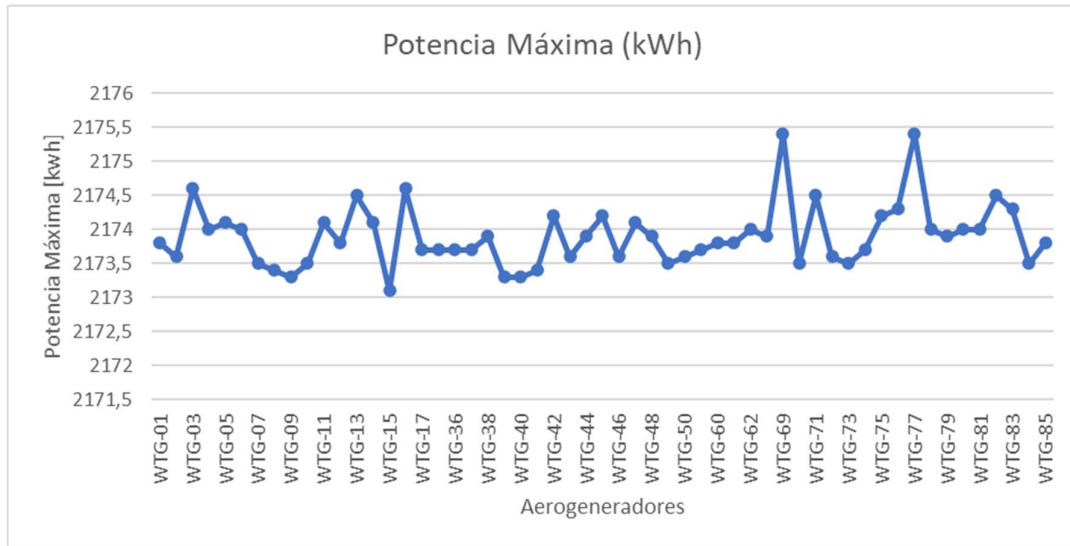

Resumen de Generación del Parque Eólico	
Mes	MWh
Enero	20.592
Febrero	17.040
Marzo	21.635
Abril	19.223
Mayo	25.108
Junio	36.077
Julio	43.120
Agosto	45.054
Septiembre	25.048
Octubre	44.916
Noviembre	29.949
Diciembre	25.399

4.1 Potencia Máxima por unidades generadoras.

La siguiente tabla muestra con más detalles la potencia máxima alcanzada por cada uno de los aerogeneradores a lo largo del año 2019, el en Anexo pueden ver la potencia máxima de cada uno de los generados de todo el día que alcanzaron la potencia máxima.

N° de Aero	Fecha/hora	Potencia Máxima (MW)
WTG-01	2019/07/30 04:10	2,173.80
WTG-02	2019/06/30 19:30	2,173.60
WTG-03	2019/10/13 17:00	2,174.60
WTG-04	2019/07/18 11:30	2,174.00
WTG-05	2019/08/06 10:40	2,174.10
WTG-06	2019/10/14 08:50	2,174.00
WTG-07	2019/09/15 15:20	2,173.50
WTG-08	2019/10/01 11:30	2,173.40
WTG-09	2019/10/13 21:00	2,173.30
WTG-10	2019/06/11 12:20	2,173.50
WTG-11	2019/08/14 12:00	2,174.10
WTG-12	2019/10/13 21:00	2,173.80
WTG-13	2019/04/09 18:30	2,174.50
WTG-14	2019/10/27 18:00	2,174.10
WTG-15	2019/03/04 18:10	2,173.10
WTG-16	2019/12/19 19:00	2,174.60
WTG-17	2019/08/14 15:50	2,173.70
WTG-35	2019/08/12 02:00	2,173.70
WTG-36	2019/08/10 01:30	2,173.70
WTG-37	2019/02/23 19:30	2,173.70
WTG-38	2019/03/18 07:20	2,173.90
WTG-39	2019/05/11 16:40	2,173.30
WTG-40	2019/11/01 13:40	2,173.30
WTG-41	2019/06/04 18:40	2,173.40
WTG-42	2019/10/14 04:30	2,174.20
WTG-43	2019/08/09 14:30	2,173.60
WTG-44	2019/08/04 06:20	2,173.90
WTG-45	2019/03/05 11:30	2,174.20

N° de Aero	Fecha/hora	Potencia Máxima (MW)
WTG-46	2019/07/06 10:10	2,173.60
WTG-47	2019/02/22 17:20	2,174.10
WTG-48	2019/01/01 21:00	2,173.90
WTG-49	2019/09/04 06:30	2,173.50
WTG-50	2019/05/10 15:10	2,173.60
WTG-51	2019/11/10 04:40	2,173.70
WTG-60	2019/05/25 13:50	2,173.80
WTG-61	2019/10/21 17:10	2,173.80
WTG-62	2019/07/31 20:10	2,174.00
WTG-63	2019/08/11 16:30	2,173.90
WTG-69	2019/05/12 20:00	2,175.40
WTG-70	2019/02/28 20:00	2,173.50
WTG-71	2019/10/14 08:50	2,174.50
WTG-72	2019/11/30 20:20	2,173.60
WTG-73	2019/07/05 23:10	2,173.50
WTG-74	2019/09/07 14:40	2,173.70
WTG-75	2019/10/25 07:10	2,174.20
WTG-76	2019/07/21 23:30	2,174.30
WTG-77	2019/09/07 23:30	2,175.40
WTG-78	2019/12/23 11:50	2,174.00
WTG-79	2019/10/14 09:00	2,173.90
WTG-80	2019/07/26 14:50	2,174.00
WTG-81	2019/10/11 10:00	2,174.00
WTG-82	2019/10/27 17:50	2,174.50
WTG-83	2019/05/06 00:50	2,174.30
WTG-84	2019/03/11 21:10	2,173.50
WTG-85	2019/08/14 02:20	2,173.80

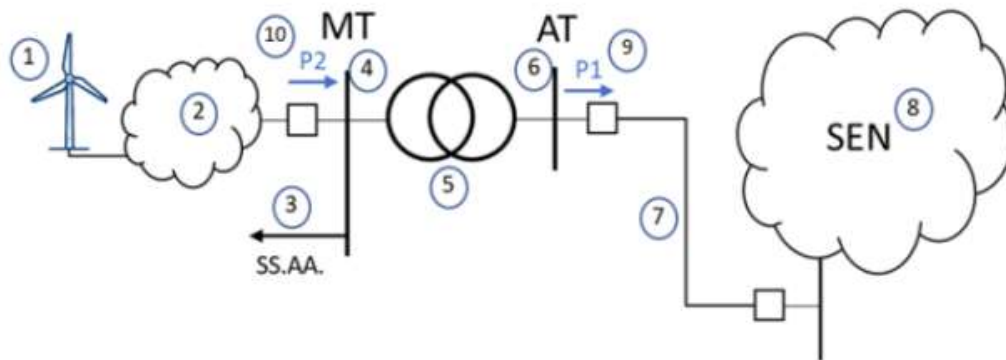

Analizando estos valores, se observa que el valor Máximo alcanzado es de 2,175.4 MW, mientras que el valor menor alcanzado es de 2173,1 MW, teniendo un promedio de Potencia Máxima alcanzada de 2,173.9MW, siendo cualquiera de estos valores superior a los 2,170 MW teóricos.

Por todo esto que los 55 Aerogeneradores tienen una potencia teórica de 2.170, lo que hace una potencia máxima bruta de parque de 119,35 MW.

Debido a las grandes dimensiones del parque eólico, junto al comportamiento del recurso es poco probable que se puede alcanzar esta potencia de forma simultánea en todos los aerogeneradores.

4.2 Potencia Máxima Bruta y Potencia Máxima Neta

Dentro de este punto mostraremos los valores de acuerdo a lo solicitado en el Anexo Técnico “Pruebas de Potencia Máxima en Unidades Generadoras”. Para ello primero se obtendrán las pérdidas de M.T. del parque, que se adjunta como anexo, obteniendo los siguientes resultados:

En donde los componentes se identifican como:

1. Parque Eólico equivalente: Corresponde a la suma de los aportes distribuidos de potencia activa alterna de cada inversor del parque ERNC.
2. Pérdidas en sistema colector del parque: Corresponde a las pérdidas del sistema colector del parque eólico principalmente en cables de baja y media tensión.
3. Servicios Auxiliares (SS.AA.) de la central.
4. Barra de media tensión (MT): Corresponde a la tensión en el lado de baja tensión del transformador de poder.
5. Transformador de Poder: Equipo elevador presente en la subestación de salida del parque ERNC.
6. Barra de alta tensión (AT): Corresponde a la tensión en el lado de alta tensión del transformador de poder.
7. Línea dedicada de la central: Línea de alta tensión que vincula el parque ERNC con el Sistema Eléctrico.
8. Sistema Eléctrico Nacional (SEN).
9. Potencia inyectada por el parque ERNC en la barra de 33kV de tensión.
10. Potencia inyectada por el parque ERNC en la barra de media tensión de su subestación de salida 220kV.

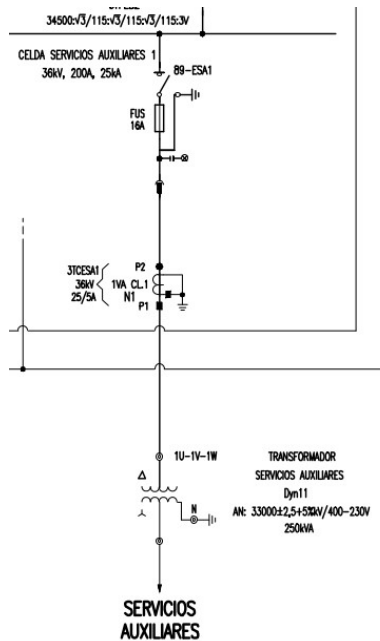

Posteriormente se definen las siguientes variables:

- a) P_1 : Potencia activa inyectada en la barra de alta tensión (AT) de la central [KW].
- b) P_{tafo} : Pérdidas activas en el transformador de poder [kW].
- c) SS.AA.: Servicios Auxiliares de la central [kW].
- d) $P_{colector}$: Pérdidas en el sistema colector del parque ERNC [kW]

Las Pérdidas del transformador de acuerdo a la hoja de datos garantizados es de 386KW, documento anexo [PECLI-DOC N° 2 - CÁLCULOS 119,5 MW.pdf].

Las pérdidas del sistema colector entre los datos medidos en los aerogeneradores y la barra de media tensión es del 1,44%, lo que corresponde a 1718.64 KW, tal y como se puede ver en documento anexo [Hoja Datos Garantizados 14Q2479007-20B.pdf].

Respecto a los datos del consumo de SSAA de la central, nos gustaría distinguir entre el consumo de los aerogeneradores en modo pausa o seguimiento y los consumos propios de la subestación, ya que hay una gran diferencia entre ambos valores. La subestación dispone de un transformador de servicios auxiliares alimentado de media tensión de 250 kW, sin medición, como se puede ver en la siguiente imagen. Pero disponemos de una indicación visual en el cuadro de Baja tensión, sin posibilidad de extracción de datos. El consumo alcanzado es de varios KW dependiendo de las diferentes cargas que demanden la energía. Se ha estimado 94 kW.

La potencia máxima activa bruta (P_{maxbruta}) en 220 kV de la central quedará definido por:

$$P_{\text{maxbruta}} = P_1 + P_{\text{trafo}} + \text{SS.AA.} + P_{\text{colector}}$$

1.	Máxima potencia aerogeneradores	119.350	[KW]
2.	P_{colector} Pérdidas en el sistema colector	1718.64	[kW]
3.	SSAA.: Servicios Auxiliares de la central	94	[kW]
5.	$P_{\text{transformador}}$: Pérdidas activas en Trans. de Poder	386	[kW]
6.	P1: Potencia Activa inyectada en la barra AT 220kV	117.151,36	[KW]
	Pmaxbruta	119,350	[MW]
	Pmaxneta	117.151,36	[MW]

5 CONCLUSIONES

De acuerdo a lo expuesto en el presente informe, se concluye que el parámetro de potencia máxima neta de parque eólico Cabo Leones I es de 117,151 MW, mientras que la potencia máxima Bruta del parque es de 119,350 MW.

ANEXO I – Datos Potencia de Cada Aerogenerador
